Project Development Phase

Project Title: Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets

1. Introduction

The project development phase is the stage where the system design is transformed into a working implementation. In this phase, the planned features and functionalities are developed and configured within the system environment. For the project **"Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets,"** the development phase focuses on configuring UI Policies in the ServiceNow platform and capturing these configurations using Update Sets for migration between instances.

The goal of this phase is to implement the system that ensures mandatory fields are enforced in ServiceNow forms and that configuration changes can be safely moved between development, testing, and production environments.

2. Development Environment Setup

Before implementing the system, a **ServiceNow Developer Instance** was set up to perform development and testing activities. This environment allows developers to create configurations, test functionalities, and verify system behavior without affecting live systems.

The following setup steps were performed:

1. Creation of a ServiceNow developer account.
2. Requesting a personal developer instance.
3. Accessing the ServiceNow platform through a web browser.
4. Configuring the development environment to begin implementing UI Policies and Update Sets.

This setup provided a controlled environment for the development process.

3. Implementation of UI Policies

The main feature implemented during the development phase was the creation of **UI Policies**. UI Policies are used to dynamically control the behavior of form fields based on specific conditions.

The development steps included:

1. Navigating to the **UI Policies module** in ServiceNow.
2. Creating a new UI Policy for the required form (such as the Incident form).
3. Defining the conditions that trigger the policy.

4. Configuring UI Policy actions to make certain fields mandatory.
5. Testing the policy to ensure it functions correctly.

For example, when a user selects a particular category in the incident form, additional fields such as **subcategory, impact, or description** automatically become mandatory. This ensures that users provide complete information before submitting the form.

4. Configuration of UI Policy Actions

After creating the UI Policy, specific **UI Policy Actions** were configured to define how the fields behave. These actions include:

- Making a field **mandatory**
- Making a field **read-only**
- Making a field **visible or hidden**

By configuring these actions, the system dynamically changes form behavior based on the user's input. This reduces the chances of incomplete form submissions and improves data quality within the system.

5. Capturing Changes Using Update Sets

After implementing UI Policies, the next step in the development phase was capturing these changes using **Update Sets**. Update Sets are used to track configuration modifications within the ServiceNow platform.

The following steps were performed:

1. Creating a new Update Set in the development instance.
2. Setting the Update Set as the **current active Update Set**.
3. Performing system configurations such as creating UI Policies.
4. Automatically capturing these changes in the Update Set.
5. Reviewing the Update Set to confirm all changes were recorded.

This process ensured that the configurations could be safely transferred to other instances.

6. Migration of Update Sets

Once the development work was completed, the Update Set containing the UI Policy configurations was prepared for migration. The migration process included:

1. Exporting the Update Set from the development instance.
2. Importing the Update Set into the target instance (testing environment).
3. Previewing the Update Set to detect potential conflicts.
4. Committing the Update Set to apply the configurations.

This step ensured that the same configurations were successfully replicated in other environments.

7. System Testing

Testing was conducted to verify that the implemented features worked correctly. The testing process included:

- Verifying that mandatory fields appear when conditions are met.
- Ensuring that forms cannot be submitted with missing required fields.
- Confirming that UI Policies activate correctly for different form inputs.
- Validating that Update Sets successfully migrate configurations.

Testing ensured that the developed solution met the project objectives.

8. Challenges Faced During Development

During the development phase, some challenges were encountered, including:

- Ensuring the correct conditions were defined for UI Policies.
- Avoiding conflicts when migrating Update Sets.
- Testing different scenarios to verify form behavior.

These challenges were addressed through repeated testing and configuration adjustments.

9. Conclusion

The project development phase successfully implemented the proposed solution using UI Policies and Update Sets within the ServiceNow platform. UI Policies ensured that mandatory fields were enforced dynamically, improving the accuracy of information submitted through forms. Meanwhile, Update Sets enabled safe migration of configuration changes across different ServiceNow environments.

The successful completion of this phase prepares the system for final testing, documentation, and demonstration. The developed solution contributes to improved data quality, efficient service management, and reliable configuration management within the ServiceNow platform.
