

Requirement Analysis

Project: Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets

1. Introduction

Requirement analysis is a crucial stage in the software development lifecycle where the needs and expectations of the system are identified and documented. In this project, the goal is to improve data accuracy and system configuration management within the ServiceNow platform. Many organizations rely on ServiceNow to manage service requests, incidents, and workflows. However, incomplete data entry can lead to system errors and inefficient processes. To overcome this problem, the system will enforce mandatory fields using UI Policies and manage configuration changes through Update Sets.

2. System Overview

The system will use UI Policies in ServiceNow to dynamically control form behavior. These policies allow administrators to define rules that make fields mandatory, read-only, or visible based on conditions. Update Sets will capture all configuration changes made in the development environment and allow them to be migrated safely to other environments such as testing and production. This ensures controlled deployment and proper configuration management.

3. Functional Requirements

- 1 The system should allow administrators to create UI Policies for different forms.
- 2 The system should enforce mandatory fields based on defined conditions.
- 3 Users should not be able to submit forms without completing required fields.
- 4 Developers should be able to capture configuration changes using Update Sets.
- 5 The system should support migration of Update Sets between instances.

4. Non-Functional Requirements

- 1 The system should provide reliable validation without affecting performance.
- 2 The configuration process should be simple and user-friendly.
- 3 Only authorized users should be able to create or migrate Update Sets.
- 4 The system should maintain data integrity and prevent incomplete records.

5. Hardware and Software Requirements

Hardware requirements include a computer with internet connectivity and at least 4 GB RAM for smooth operation. Software requirements include a modern web browser such as Google Chrome or Microsoft Edge and access to a ServiceNow Developer Instance. These tools allow developers to configure UI Policies and manage Update Sets for testing and deployment.

6. User Requirements

The system involves three types of users. Administrators create and manage UI Policies to control form behavior. Developers configure system features and manage Update Sets for migration between instances. End users interact with ServiceNow forms and must complete mandatory fields before submitting requests.

7. Summary

The requirement analysis phase defines the necessary system features, operational needs, and user expectations for the project. By implementing UI Policies and Update Sets, the system ensures accurate data entry, efficient configuration management, and reliable deployment across ServiceNow environments.
