

Project Documentation

Project Title: Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets

1. Introduction

Project documentation is an essential part of the software development lifecycle. It provides detailed information about the system, its development process, configuration steps, and implementation procedures. Proper documentation helps developers, administrators, and users understand how the system works and how it can be maintained or modified in the future.

For the project “**Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets**,” the documentation describes the process of implementing UI Policies in the ServiceNow platform and managing configuration changes using Update Sets. This documentation serves as a reference for understanding the project objectives, system configuration, and operational workflow.

2. Overview of the System

The developed system focuses on improving the quality of data entered in ServiceNow forms and ensuring that configuration changes can be safely migrated across different ServiceNow environments.

The system uses two important ServiceNow features:

UI Policies – Used to enforce mandatory fields dynamically in forms.

Update Sets – Used to capture and migrate configuration changes between instances.

By integrating these two features, the system ensures that users provide complete information when submitting forms and that configuration changes can be transferred safely between development, testing, and production environments.

3. System Components

The project consists of several components that work together to achieve the desired functionality.

ServiceNow Forms

Forms such as the Incident form are used by users to report issues or request services.

UI Policies

UI Policies control the behavior of form fields based on specific conditions. They help ensure that required fields are completed before submission.

UI Policy Actions

These define the actions performed by UI Policies, such as making a field mandatory, read-only, or visible.

Update Sets

Update Sets capture configuration changes made in the development instance and allow them to be migrated to other ServiceNow instances.

4. Implementation Process

The system was implemented in the ServiceNow development environment using the following steps:

1. Creation of a ServiceNow developer instance.
2. Identification of forms where mandatory fields need to be enforced.
3. Creation of UI Policies for those forms.
4. Configuration of UI Policy actions to make fields mandatory.
5. Testing of UI Policies to verify correct functionality.
6. Creation of Update Sets to capture configuration changes.
7. Migration of Update Sets to testing or production instances.

This step-by-step process ensured that the configurations were implemented correctly and could be transferred safely across environments.

5. Testing and Validation

Testing is an important part of project documentation because it verifies that the system functions as expected. During testing, different scenarios were evaluated to ensure the UI Policies work correctly.

The following tests were performed:

- Verifying that fields become mandatory when specific conditions are met.
- Ensuring that users cannot submit forms without completing required fields.
- Checking that UI Policies activate dynamically during form interaction.
- Validating that Update Sets successfully migrate configuration changes.

The results confirmed that the system functions correctly and improves the accuracy of form submissions.

6. Advantages of the System

The implemented system offers several advantages:

- Improves **data accuracy** by ensuring mandatory fields are filled.
- Reduces **incident resolution time** by providing complete information.

- Enhances **system reliability** through structured configuration management.
- Simplifies **migration of changes** using Update Sets.
- Reduces manual errors in configuration deployment.

These benefits contribute to more efficient service management operations.

7. Limitations of the System

Although the system improves form validation and configuration management, some limitations exist:

- UI Policies must be carefully configured to avoid conflicts.
- Incorrect conditions may cause unnecessary mandatory fields.
- Update Sets must be tested before deployment to prevent system errors.

Proper testing and configuration management can minimize these limitations.

8. Future Enhancements

The system can be further improved by adding advanced features such as:

- Automated validation rules for more complex conditions.
- Integration with workflows to automate incident management processes.
- Enhanced user interface customization for better user experience.
- Automated deployment tools for faster migration of configuration changes.

These improvements can further enhance the effectiveness of the system.

9. Conclusion

Project documentation provides a complete record of the system design, implementation, and operation. For the project “**Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets,**” the documentation explains how UI Policies enforce mandatory fields and how Update Sets enable safe migration of configuration changes.
