

Project Demonstration

Project Title: Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets

1. Introduction

The project demonstration phase is the final stage of the project development process. In this phase, the implemented system is presented and explained to show how it works in a real environment. The purpose of the demonstration is to verify that the system meets the project objectives and performs the intended functions effectively.

For the project “**Enforcing Mandatory Fields Using UI Policies and Migrating Changes with Update Sets,**” the demonstration focuses on showing how UI Policies enforce mandatory fields within ServiceNow forms and how Update Sets are used to migrate configuration changes between ServiceNow instances.

2. Demonstration Environment

The project demonstration was conducted using a **ServiceNow Developer Instance**, which provides a platform to configure, test, and display the implemented features. The demonstration involved accessing the ServiceNow interface through a web browser and navigating to the relevant modules where UI Policies and Update Sets were configured.

The demonstration environment included:

- ServiceNow Developer Instance
- Incident Form for testing mandatory fields
- UI Policies configured within the system
- Update Sets created to capture configuration changes

This environment allowed the system behavior to be displayed clearly and effectively.

3. Demonstration of UI Policies

The first part of the demonstration focused on the implementation of **UI Policies** in ServiceNow forms. The steps performed during the demonstration included:

1. Logging into the ServiceNow developer instance.
2. Navigating to the **UI Policies module**.
3. Displaying the configured UI Policy created for the incident form.
4. Explaining the conditions defined in the UI Policy.
5. Showing the UI Policy actions that make specific fields mandatory.

After explaining the configuration, the incident form was opened to demonstrate how the UI Policy works in practice. When the user selects a specific category or condition in the form, additional fields automatically become mandatory. If the user attempts to submit the form without completing these fields, the system prevents submission and prompts the user to enter the required information.

This demonstration shows how UI Policies help ensure that complete and accurate data is collected from users.

4. Demonstration of Update Sets

The second part of the demonstration focused on **Update Sets**, which are used to capture and migrate configuration changes.

The demonstration included the following steps:

1. Creating a new Update Set in the development instance.
2. Setting the Update Set as the active Update Set.
3. Performing configuration changes such as creating UI Policies.
4. Showing how these changes are automatically captured in the Update Set.
5. Reviewing the Update Set to confirm that the configurations were recorded.

The Update Set was then prepared for migration to another instance. The process of exporting, importing, and committing the Update Set was explained to show how configuration changes can be safely transferred between ServiceNow environments.

5. System Functionality Verification

During the demonstration, the system functionality was verified by testing different scenarios.

The following checks were performed:

- Verifying that mandatory fields appear when the defined conditions are met.
- Ensuring that users cannot submit forms without filling the required fields.
- Confirming that UI Policies dynamically control the behavior of form fields.
- Demonstrating that configuration changes are successfully captured in Update Sets.

The successful completion of these tests confirmed that the system operates correctly and meets the project objectives.

6. Benefits Observed During Demonstration

The demonstration highlighted several benefits of the implemented system:

- Improved accuracy of information entered in ServiceNow forms.
- Reduction in incomplete records submitted by users.

- Better support for incident management processes.
- Reliable migration of configuration changes using Update Sets.
- Improved system consistency across different environments.

These benefits contribute to more efficient IT service management within organizations.

7. Conclusion

The project demonstration successfully showed the working implementation of **UI Policies and Update Sets** in the ServiceNow platform. UI Policies enforce mandatory fields in forms, ensuring that users provide complete and accurate information when submitting records. Update Sets provide a structured method for migrating configuration changes across ServiceNow instances.

The demonstration confirmed that the project achieves its primary objective of improving data quality and maintaining configuration consistency within the system. The implemented solution can help organizations manage their service management processes more effectively and reliably.
